# 2 Analysis 1a. The development of reaches, hold out and gives (HoGs), and points from 10-12 months.

For analysis 1a, we fitted a series of GAMMs using the negative binomial function. The choice of using the negative binomial rather than the Poisson distribution is justified by the overdispersion of the data (and the very long tail in the distribution). The negative binomial distribution requires the specification of the theta parameter. The parameter has been estimated from the data by fitting a generalised linear model with the negative binomial distribution using MASS::glm.nb.

### 2.1 Reaches development

The following models test cultural group.

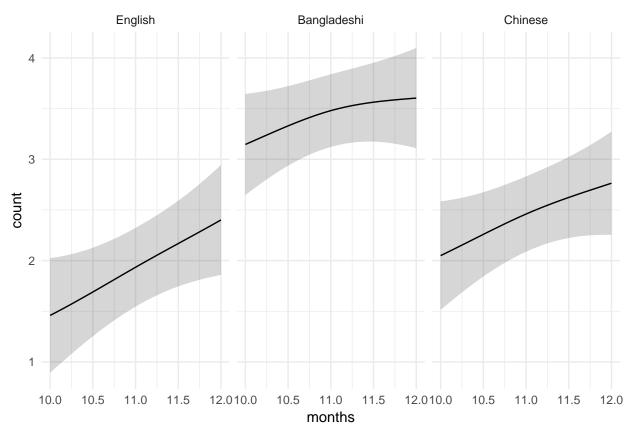

```
reach_nb <- glm.nb(count ~ months, data = reach_tot)

reach_gam <- gam(
    count ~
        back_o +
        s(months, k = 3) +
        s(months, k = 3, by = back_o) +
        s(months, dyad, k = 2, bs = "fs", m = 1),
    data = reach_tot,
    method = "ML",
    family = negbin(0.986)
)</pre>
```

```
