# Statistical analysis

#### 1 Read data

These chunks read the data and processes it for analysis.

The following reads gestures.csv and utterances.csv into gesture\_tot and utterances\_tot. gestures\_tot has time series data of infant gestures and maternal Contingent Talks at 10, 11, and 12 months. utterance\_tot has time series data of maternal utterances at 10, 11, and 12 months. Data is aggregated from the two experimental activities.

```
gestures <- read_csv("./data/gestures.csv")</pre>
gestures_tot <- gestures %>%
  group_by(dyad, background, months, gesture) %>%
  summarise(
    count = sum(count),
    ct = sum(ct)
  ) %>%
  ungroup() %>%
  mutate(
    gesture = factor(gesture, levels = c("reach", "point", "ho_gv"))
  mutate_if(is.character, as.factor) %>%
  mutate(
    # Needed for GAMs
    back_o = ordered(background, levels = c("English", "Bengali", "Chinese"))
  )
# Needed for GAMs
contrasts(gestures_tot$back_o) <- "contr.treatment"</pre>
utterances <- read_csv("./data/utterances.csv")</pre>
utterances_tot <- utterances %>%
  group_by(dyad, background, months) %>%
  summarise(
   utterances = sum(utterances) # there are NAs that must be kept
  ) %>%
  ungroup() %>%
  mutate_if(is.character, as.factor) %>%
  mutate(
    # Needed for GAMs
    back_o = ordered(background, levels = c("English", "Bengali", "Chinese"))
# Needed for GAMs
contrasts(utterances_tot$back_o) <- "contr.treatment"</pre>
```

Here we create individual datasets for HoGs, reaches, pointing, and a dataset with aggreagated gestures count and maternal contingent talks (all\_tot).

```
hg_tot <- filter(gestures_tot, gesture == "ho_gv")
reach_tot <- filter(gestures_tot, gesture == "reach")
point_tot <- filter(gestures_tot, gesture == "point")

# Count = all gestures count, CT is aggregated from all gestures types
all_tot <- gestures_tot %>%
    group_by(dyad, back_o, months) %>%
    summarise(count = sum(count), ct = sum(ct))
```

The following code creates datasets for the analysis of pointing as predicted by HoGs, reaches, maternal CTs, and maternal utterances. The datasets are constructed so that the count of pointing at 11 months is matched with the count of gesture/utterances at 10 months, and the pointing at 12 is matched with the count of gesture/utterances at 11 months. Pointing at 10 months is dropped (since there is no data at 9 months).

```
hg_point_lead <- gestures_tot %>%
  dplyr::select(-ct) %>%
  spread(gesture, count) %>%
  dplyr::select(-reach) %>%
  group_by(dyad) %>%
  mutate(
    lead_point = lead(point)
  ) %>%
  filter(months != 12)
reach_point_lead <- gestures_tot %>%
  dplyr::select(-ct) %>%
  spread(gesture, count) %>%
  dplyr::select(-ho_gv) %>%
  group_by(dyad) %>%
  mutate(
    lead_point = lead(point)
  ) %>%
  filter(months != 12)
ct_point_lead <- gestures_tot %>%
  filter(gesture == "point") %>%
  dplyr::select(-gesture) %>%
  rename(point = count) %>%
  group_by(dyad) %>%
  mutate(
    lead_point = lead(point)
  ) %>%
  filter(months != 12)
utter_point_lead <- gestures_tot %>%
  filter(gesture == "point") %>%
  right_join(y = utterances_tot) %>%
  group_by(dyad) %>%
  mutate(
    lead_point = lead(count)
  ) %>%
  filter(months != 12)
```

The following creates a dataset with the infants' vocabulary counts and total counts of all gestures, HoGs + point, reaches,

maternal utterances and maternal contingent talks.

```
hgp_tot <- gestures_tot %>%
  filter(gesture != "reach") %>%
  group_by(dyad, background) %>%
  summarise(hgp_tot = sum(count))
reach_tot_2 <- gestures_tot %>%
  filter(gesture == "reach") %>%
  group_by(dyad, background) %>%
  summarise(reach_tot = sum(count))
vocab_gest <- gestures_tot %>%
  group_by(dyad, background) %>%
  summarise(count_tot = sum(count), ct_tot = sum(ct)) %>%
  ungroup() %>%
  full_join(y = hgp_tot) %>%
  full_join(y = reach_tot_2) %>%
  mutate_if(is.factor, as.character)
vocab_utt <- utterances_tot %>%
  group_by(dyad, background) %>%
  summarise(utt_tot = sum(utterances)) %>%
  ungroup() %>%
  mutate_if(is.factor, as.character)
vocab <- read_csv("./data/vocab.csv") %>%
  full_join(y = vocab_gest) %>%
  full_join(y = vocab_utt) %>%
  arrange(dyad, months) %>%
  mutate(
    months = as.factor(months),
   background = factor(background, levels = c("English", "Bengali", "Chinese"))
  mutate if(is.character, as.factor)
```

# 2 Analysis 1a. The development of reaches, hold out and gives (HoGs), and points from 10-12 months.

For analysis 1a, we fitted a series of GAMMs using the negative binomial function. The choice of using the negative binomial rather than the Poisson distribution is justified by the overdispersion of the data (and the very long tail in the distribution). The negative binomial distribution requires the specification of the theta parameter. The parameter has been estimated from the data by fitting a generalised linear model with the negative binomial distribution using MASS::glm.nb.

Cultural background and development (within the 10-12 months sampling period) were tested separately with two series of models for each gesture (HoGs, reaches, pointing) and maternal scores (maternal utterances and maternal contingent talks). To test the significance of background and development we compared a full model including the relevant parameter with one in which the parameter is dropped, using itsadug::compareML().

The full models testing background contain the following terms: a parametric term for background (back\_o), a reference smooth over sampling period (s (months), 10-12), a difference smooth over sampling period by backround (s (months, by = back\_o)), and a random smooth over sampling period by infant (s (months, dyad), this corresponds to LME random smooths and intercepts). The reference smooth corresponds to the smooth of development in English infants, while the difference smooth models the difference between the smooth of English infants and those of Bengali and Chinese infants.

The full models testing development contain the following terms: a smooth over sampling period and a random smooth over sampling period by infant (s (months, dyad), this corresponds to LME random smooths and intercepts).

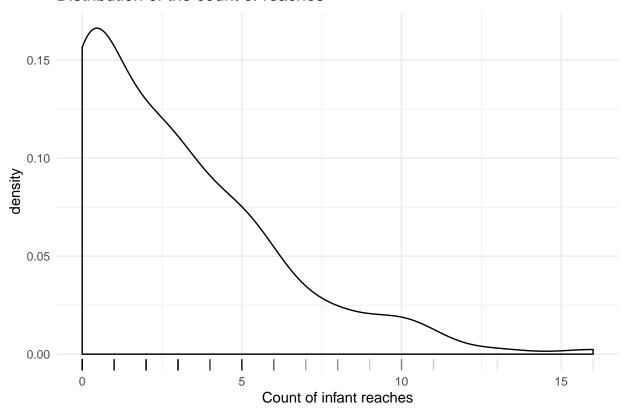

The null models for background rop all terms including background (back\_o) while the null models for development drop the smooth over sampling period (s (months)), but keep the random smooths (comparison can be done either on the fixed effect structure or the random effects structure at a time).

The warnings about repeated 1-d smooths do not indicate problems with the models, but they only inform the user about multiple smooths over the same variable (which are needed).

#### 2.1 Reaches development

```
reach_tot %>%
  ggplot(aes(count)) + geom_density() + geom_rug(alpha = 0.1) +
labs(
  title = "Distribution of the count of reaches",
  x = "Count of infant reaches"
)
```

#### Distribution of the count of reaches

The following models test cultural group for infant reaches.

```
\# Estimation of theta for the negbin() family
reach_nb <- glm.nb(count ~ months, data = reach_tot)</pre>
theta <- summary(reach_nb)[["theta"]]</pre>
reach_gam <- gam(</pre>
